# 1 Topological Groups and Actions

## 1.1 Basic Definitions

### Definition 1.1.1: Topological Groups

Let  $G$  be a group. We say that  $G$  is a topological group if  $G$  is also a topological space and that the following are true.

- The map  $l_h : G \rightarrow G$  defined by  $g \mapsto hg$  is continuous for all  $h \in G$
- The map  $i : G \rightarrow G$  defined by  $g \mapsto g^{-1}$  is continuous

## 1.2 Continuous Group Actions

In algebraic topology, we have the results of considering groups acting on spaces. We can in fact consider topological groups acting on spaces.

### Definition 1.2.1: Continuous Group Actions

Let  $G$  be a topological group and  $X$  a space. We say that  $G$  is a continuous group action if  $G$  is a group acting on  $X$  such that the group action map

$$\cdot : G \times X \rightarrow X$$

is continuous.

Frequently a continuous group action is also called a (topological) transformation group, for example in Milnor's Topology of Fiber Bundles.

### Proposition 1.2.2

Let  $G$  be a continuous group action of  $X$ . Then for each  $g \in G$ , the map  $A_g : X \rightarrow X$  defined by  $x \mapsto g \cdot x$  is a homeomorphism.

*Proof.* Every element of  $g$  has an inverse  $g^{-1}$  which are both continuous and are bijections on  $X$ . □

### Proposition 1.2.3

Let  $G$  be a topological group and  $(X, \mathcal{T})$  a topological space. Then  $G$  is a continuous group action on  $X$  if and only if  $G$  acts on  $\mathcal{T}$ .

*Proof.* Suppose that  $G$  is a continuous group action on  $X$ . Then for each  $g \in G$ ,  $g \cdot U = \{g \cdot x \mid x \in U\}$  for  $U \in \mathcal{T}$  is open since  $A_g$  as above is a homeomorphism. Now suppose that  $G$  acts on  $\mathcal{T}$ . Then for each open set  $U$  of  $X$ ,  $g^{-1} \cdot U$  is open. Thus  $G$  is a continuous group action. □

In particular, some authors would assume one knows this fact, so it is always nice to see it spelled out. It is also standard to denote this action just by the element  $g$  instead of  $A_g$ . Notice that in particular, if  $G$  is a continuous group action, then there is a homomorphism  $G \rightarrow \text{Homeo}(X)$ . If this homomorphism is injective, then  $G$  includes into  $\text{Homeo}(X)$  so that  $G$  is a subgroup of homeomorphisms.

**Definition 1.2.4: Group of Diffeomorphisms**

Let  $G$  be a continuous group action on a space  $X$ . We say that  $G$  is a group of homeomorphisms of  $X$  if for every  $g \in G$ , the map

$$x \mapsto g \cdot x$$

is a homeomorphism.

**1.3 Properly Discontinuous Group Actions****Definition 1.3.1: Proper Group Actions**

Let  $G$  be a topological group acting continuously on a topological space  $X$ . The action is said to be proper if the map  $G \times X \rightarrow X \times X$  defined by

$$(g, x) \mapsto (x, g \cdot x)$$

is a proper map.

**Definition 1.3.2: Properly Discontinuous Group Actions**

Let  $G$  be a group acting on a space  $X$ . Then we say that  $G$  is a properly discontinuous group action if for every compact set  $K \subseteq X$ , we have

$$(g \cdot K) \cap K \neq \emptyset$$

for finitely many  $g \in G$ .

**Proposition 1.3.3**

Every properly discontinuous group action is a wandering action.

**Proposition 1.3.4**

If  $G$  is a proper group action on a space  $X$ , then the action is properly discontinuous.

The converse is not true in general, unless we assume that  $X$  is locally compact.

Recall the notion of a covering space action.  $G$  is a covering space action on  $X$  if  $g \cdot U \cap U \neq \emptyset$  implies  $g = 1$ . This is also related to properly discontinuous group actions. In fact, properly discontinuous group actions are in general stronger than covering space actions.

**Proposition 1.3.5**

Let  $G$  be a covering space action on  $X$ . If  $X$  is locally compact and Hausdorff, then  $G$  is a properly discontinuous group action on  $X$ .

## 2 The Coset Space

### 2.1 The Topology of Coset Spaces

#### Definition 2.1.1: Coset Space

Let  $B$  be a topological group and  $G$  a closed subgroup of  $B$ . The coset space of  $B$  by  $G$  is the set

$$B/G = \{bG \mid b \in B\}$$

together with the topology in which  $U \subseteq B/G$  is open  $p^{-1}(U)$  is open, where  $p : B \rightarrow B/G$  is the quotient homomorphism.

Note that there is also a definition of the coset space by right cosets instead of left. However it is easy to show that they are homeomorphic through the inverse map  $b \mapsto b^{-1}$  for each  $b \in B$ .

#### Proposition 2.1.2

Let  $B$  be a topological group and  $G$  a closed subgroup of  $B$ . Then the quotient map  $p : B \rightarrow B/G$  is an open map.

#### Proposition 2.1.3

Let  $B$  be a topological group and  $G$  a closed subgroup of  $B$ . Then  $B/G$  is a Hausdorff space.

### 2.2 Coset Spaces of Transitive Actions

#### Proposition 2.2.1

Let  $G$  be a topological group acting continuously on a space  $X$ . Let  $x_0 \in X$ . Then the map

$$p : \frac{G}{\text{Stab}_G(x_0)} \rightarrow Gx_0 \subseteq X$$

given by  $g \mapsto g \cdot x_0$  is well defined, and moreover, a homeomorphism.

#### Corollary 2.2.2

Let  $G$  be a topological group acting continuously on a space  $X$ . Then there exists a normal subgroup  $H$  of  $G$  such that

$$\frac{G}{H} \cong X$$

### 2.3 Coset Spaces with the Group Action of the Base Space

#### Definition 2.3.1: The Translation Map

Let  $B$  be a topological group and  $G$  a closed subgroup of  $B$ . Let  $b \in B$  and suppose that  $p : B \rightarrow B/G$  is the quotient map. Define the translation map  $B \times B/G \rightarrow B/G$  defined by

$$(b, x) \mapsto p(bp^{-1}(x))$$

**Proposition 2.3.2**

Let  $B$  be a topological group and  $G$  a closed subgroup of  $B$ . Then the translation map is a continuous group action of  $B$  on  $B/G$ . Moreover,  $B$  is a group of homeomorphisms of  $B/G$ .

**Proposition 2.3.3**

Let  $B$  be a topological group and  $G$  a closed subgroup of  $B$ . Let

$$G_0 = \bigcap_{b \in B} bGb^{-1}$$

Then  $B/G_0$  acts faithfully on  $B/G$ . Moreover,  $B/G_0$  is a group acting continuously on  $B/G$ .
