1 Introduction to Infinity Categories

1.1 Infinity Categories and Some Examples

We recall some basic facts about simplicial sets. If $S: \Delta \to \mathbf{Set}$ is a simplicial set, then by Yoneda's emebdding we know that the n-simplices of S are given by

$$S([n]) = \operatorname{Hom}_{\mathbf{sSet}}(\Delta^n, S)$$

In other words, specifying an *n*-simplex is the same as specifying a map of simplicial sets

$$\Delta^n \to S$$

The foundations of infinity categories lay on the simplicial sets. Intuitively, any face $\partial_k \Delta$ of an n-simplex Δ captures a homotopy of the faces of $\partial_k \Delta$.

Definition 1.1.1: Infinity Categories

An infinity category is a simplicial set C such that each inner horn admits a filler. In other words, for all 0 < i < n, the following diagram commutes:

$$\begin{array}{ccc} \Lambda_i^n & \xrightarrow{\forall} & C \\ \downarrow & & & \\ \Delta^n & & & \end{array}$$

Definition 1.1.2: Objects and Morphisms

Let C be an infinity category. Define the following notions for C.

- Define the objects of C to be the 0-simplices of C.
- Define the morphisms of C to be the 1-simplices of C.

Theorem 1.1.3

Let \mathcal{C} be a category. Every inner horn of the nerve N(C) of \mathcal{C} admits a filler and hence is an infinity category.

1.2 Joins and Slices

We begin by rewriting the definition of a simplex category as follows. Instead of having distinguished names [n] for the objects, we instead just think of the simplex category with objects as finite and totally ordered sets. Indeed any of these sets will be in bijection to [n] for some $n \in \mathbb{N}$. This language will help us define the join.

Definition 1.2.1

Let J be a finite and totally ordered set. A cut of J consists of two subsets $I,I'\subseteq J$ such that

$$J = I \coprod I'$$

and i < i' for all $i \in I$ and i' < I'.

Definition 1.2.2: Joins

Let X, Y be simplicial sets. Define the join of X and Y to be the simplicial set X * Y as follows.

• Denote $J \neq \emptyset$ any finite and totally ordered set. Define

$$X*Y(J) = \coprod_{\substack{I \coprod I' = J \\ i < i' \text{ for } i \in I, i' \in I'}} X(I) \times Y(I') \coprod_{I,I' \text{ cuts of } J} X(I) \times Y(I')$$

where by convention, $X(\emptyset) = Y(\emptyset) = *$.

ullet For two finite and totally ordered sets J and J' and a morphism $J \to J'$ preserving order, the map

$$(X*Y)[J'] \to (X*Y)[J]$$

is defined as follows. Let K,K' be a cut of J'. Then α restricts to two well defined maps

$$\alpha|_{\alpha^{-1}(K)}:\alpha^{-1}(K)\to K \quad \text{ and } \quad \alpha|_{\alpha^{-1}(K')}:\alpha^{-1}(K')\to K'$$

In particular these are order preserving, and each are morphisms in the simplex category Δ . Thus this gives us a unique morphism

$$X(K) \times X(K') \to X(\alpha^{-1}(K)) \times X(\alpha^{-1}(K'))$$

By taking the product of these maps, we thus obtain a morphism $(X*Y)[J'] \to (X*Y)[J]$, turning the above definition into a simplicial set.

Concrete examples:

• When J = [0], we have that

$$(X * Y)[0] = X[0] \times Y(\emptyset) \coprod X(\emptyset) \times Y[0]$$

= $X_0 \coprod Y_0$

which means that the vertices of X * Y are the vertices of X and Y combined disjointly.

• When J = [1], we have that

$$\begin{split} (X*Y)[1] &= X[1] \times Y(\emptyset) \amalg X(\{0\}) \times Y(\{1\}) \amalg X(\emptyset) \times Y[1] \\ &= X_1 \amalg X_0 \times Y_0 \amalg Y_1 \end{split}$$

TBA: The join of ordinary categories.

Lemma 1.2.3

Let X and Y be simplicial sets. Then $N(X * Y) \cong N(X) * N(Y)$

TBA: functoriality of join

Proposition 1.2.4

Let X, Y be simplicial sets. Then X * Y is an infinity category if and only if X and Y are infinity categories.

Recall that the over category \mathcal{C}/X consists of pairs $(Y, f: Y \to X)$ and morphism are given by commutative diagrams. Let us rephrase the definition as follows. The over category is the unique category such that if \mathcal{D} is another category, there is a bijection

$$\operatorname{Hom}_{\mathbf{CAT}}(\mathcal{D}, \mathcal{C}/X) \cong \operatorname{Hom}_X(\mathcal{D} * [0], \mathcal{C})$$

where the right hand side indicates that we only consider morphisms $\mathcal{D}*[0] \to \mathcal{C}$ in which [0] is mapped to X. This characterization is due to the fact that a morphism $[0] \to \mathcal{C}$ is essentially a choice of object in \mathcal{C} , in which case we choose to be X.

Definition 1.2.5: Over Category for Infinity Categories

Let K, X be simplicial sets. Let $f: K \to X$ be a map. Define the over category (which is a simplicial set)

$$f/X:\Delta\to\mathbf{Set}$$

as follows.

 \bullet For each n, we have

$$(f/X)_n = \operatorname{Hom}_{K/\mathbf{sSet}}(K * \Delta^n, X)$$

TBA: Adjunction of join and slice.

1.3

For an ordinary category C, we have the notion of Hom sets (at least for locally small categories). We would like to reproduce this notion for infinity categories.

Recall that a an n-simplex x is degenerate if any two of its consecutive vertices are given by the same element. Explicitly, this means that x lies in the image of some degeneracy map s_k .

Definition 1.3.1: The Right Mapping Space

Let \mathcal{C} be an infinity category. Let $x,y\in\mathcal{C}$ be objects. Define the right mapping space from x to y to be the simplicial set defined by

$$\operatorname{Hom}_{\mathcal{C}}^{R}(x,y)([n]) = \left\{ h \in \mathcal{C}_{n+1} \;\middle|\; d_{n+1}(h) = \underbrace{(\underline{s_{0} \circ \cdots \circ s_{0}})}_{n \text{ times}}(x) \text{ and } (d_{0} \circ \cdots \circ d_{n})(h) = y \right\}$$

for each $n \in \mathbb{N}$.

In plain English, the hom set from x to y on the nth level consists of n+1-simplices h for which the face of h with the first n-vertices are given by the n simplex $[x, \ldots, x]$, while the last vertex of h is given by y.

Definition 1.3.2: The Left Mapping Space

Let \mathcal{C} be an infinity category. Let $x,y\in\mathcal{C}$ be objects. Define the left mapping space from x to y to be the simplicial set defined by

$$\operatorname{Hom}_{\mathcal{C}}^{L}(x,y)([n]) = \left\{ h \in \mathcal{C}_{n+1} \mid d_{n+1}(h) = \underbrace{(s_{0} \circ \cdots \circ s_{0})}_{n \text{ times}}(y) \text{ and } (d_{0} \circ \cdots \circ d_{n})(h) = x \right\}$$

for each $n \in \mathbb{N}$.

These two notions are equivalent up to homotopy (Land) Also pullbacks (Land)

Proposition 1.3.3

Let \mathcal{C} be an infinity category. Let $x,y\in\mathcal{C}$. Then both mapping spaces $\mathrm{Hom}_{\mathcal{C}}^R(x,y)$ and $\mathrm{Hom}_{\mathcal{C}}^L(x,y)$ are Kan complexes.

1.4 Homotopy Infinity Categories

Recall that for a simplicial set X, we defined the homotopy category h(X) of X. Such an assignment is functorial. In the case of infinity categories, we can exhibit the structure of h(X) more explicitly.

Definition 1.4.1: Homotopic Morphisms

Let $\mathcal C$ be an infinity category. Two morphisms $f,g:C\to D$ are said to be homotopic if there exists a 2-simplex σ such that

- $d_0(\sigma) = \mathrm{id}_D$
- $d_1(\sigma) = g$
- $d_2(\sigma) = f$

In this case we write $f \simeq g$.

Lemma 1.4.2

Homotopy is an equivalence relation in any infinity category.

Proposition 1.4.3

Let C be an infinity category. Let $f, f': C \to D$ and $g, g': D \to E$ be morphisms in C. If $f \simeq f'$ and $g \simeq g'$, then

$$g \circ f \simeq g' \circ f'$$

Definition 1.4.4: Homotopy Category

Let C be an infinity category. Define the homotopy category h(C) of C to consist of the following.

- ullet The objects are the objects of C
- The morphisms are equivalent classes of morphisms [f] for f a morphism in C
- Composition is defined by

$$[g] \circ [f] = [g \circ f]$$

which is well defined by the above.

Definition 1.4.5: Isomorphisms in Infinity Categories

Let C be an infinity category. Let $f:C\to D$ be a morphism. We say that f is an isomorphism if there exists $g:D\to C$ such that $g\circ f\simeq \mathrm{id}_C$ and $f\circ g\simeq \mathrm{id}_D$.

Lemma 1.4.6

Let C be an infinity category. Let $f:C\to D$ be a morphism. Then f is an isomorphism in C if and only if [f] is an isomorphism in h(C).

2 Infinity Categories in Topology

Lemma 2.0.1

Let X be a space. Then applying the singular functor S(X) gives an infinity category.

Proposition 2.0.2

Let X be a space. Then the homotopy category of the singular set of X is equal to $h(S(X)) = \prod_{1}(X)$ the fundamental groupoid of X.

2.1 Kan Complexes

Definition 2.1.1: Kan Complexes

A Kan complex is a simplicial set C such that each horn (inner and outer) admits a filler. In other words, for all $0 \le i \le n$, the following diagram commutes:

$$\begin{array}{ccc} \Lambda_i^n & \xrightarrow{\forall} & C \\ & & \\ \downarrow & & \\ \Delta^n & & \end{array}$$

Since infinity catregories require only inner horns to admit a filler, we have the following inclusion relation:

$$_{Categories}^{Infinity} \subset \mathop{Complexes}\limits^{Kan}$$

Proposition 2.1.2

Let X be a space. Then S(X) is a Kan complex.

Theorem 2.1.3

Let $\mathcal C$ be a small category. Then the simplicial set $N(\mathcal C)$ is a Kan complex if and only if $\mathcal C$ is a groupoid.

More: Kan complexes = infinity groupoids (quillen equivalence in model category), and we should think of spaces as Kan complexes / infinity groupoids from now on.

3 Limits and Colimits

3.1 Terminal and Initial Objects

Definition 3.1.1: Initial and Terminal Objects

Let \mathcal{C} be an infinity category. Let $x \in \mathcal{C}$ be an object.

• We say that x is initial if for all objects $y \in \mathcal{C}$, there is a homotopy equivalence

$$\operatorname{Hom}_{\mathcal{C}}(x,y) \simeq \Delta^0$$

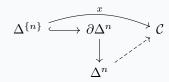

ullet Dually, we say that x is terminal if for all objects $y \in \mathcal{C}$, there is a homotopy equivalence

$$\operatorname{Hom}_{\mathcal{C}}(y,x) \simeq \Delta^0$$

Proposition 3.1.2

Let \mathcal{C} be an infinity category. Let $x \in \mathcal{C}$ be an object. Then the following are equivalent.

- \bullet x is terminal.
- For all $n \ge 1$, every lifting problem of the form

3.2 Limits and Colimits

Definition 3.2.1: Limits in Infinity Categories

Let K, X be infinity categories. Let $F: K \to X$ be a map. Define the limit

$$\lim_{F} X$$

of F over X to be the terminal object of the slice category X/F if it exists.
