1 Topological K-Theory

1.1 Stably Trivial Vector Bundles

Definition 1.1.1: Stable Trivial Vector Bundles

Let $k = \mathbb{R}$ or \mathbb{C} . Let X be a space. Let $p: E \to X$ be a vector bundle over k. We say that p is stably trivial if there exists a vector bundle $p': E' \to X$ such that

$$E \oplus E' \cong X \times k^n$$

for some $n \in \mathbb{N}$.

Proposition 1.1.2

Let *X* be a compact Hausdorff space. Then every vector bundle over *X* is stably trivial.

1.2 Real K-Theory

Let X be a space. Recall that $\mathrm{Vect}^{\mathbb{R}}(X)$ denotes the set of isomorphism classes of real vector bundles over \mathbb{R} .

Definition 1.2.1: Real K-Theory

Let X be a compact Hausdorff space. Define the real K-theory of X to be the Grothendieck completion

$$KO(X) = Gr(Vect^{\mathbb{R}}(X), \oplus)$$

Proposition 1.2.2

Let X,Y be compact Hausdorff spaces. Let $f:X\to Y$ be continuous. Then the pullback of vector bundles along f induces a group homomorphism

$$f^*: KO(Y) \to KO(X)$$

1.3 Complex K-Theory

Definition 1.3.1: Complex K-Theory

Let X be a compact Hausdorff space. Define the complex K-theory of X to be the Grothendieck completion

$$KU(X) = Gr(Vect^{\mathbb{C}}(X), \oplus)$$

Proposition 1.3.2

Let X,Y be compact Hausdorff spaces. Let $f:X\to Y$ be continuous. Then the pullback of vector bundles along f induces a group homomorphism

$$f^*: KU(Y) \to KU(X)$$

Definition 1.3.3: The Complex K-Theory Functor

Define the complex K-theory functor

$$KU : \mathbf{CHaus} \to \mathbf{Ab}$$

to consist of the following.

- For each compact Hausdorff space X, KU(X) is the abelian group of isomorphism classes of complex vector bundles together with the Whitney sum.
- For each continuous map $f: X \to Y$, $KU(f) = f^*: KU(Y) \to KU(X)$ is the induced group homomorphism of the pullback of vector bundles.

Proposition 1.3.4

Let X,Y be compact Hausdorff spaces. Let $f,g:X\to Y$ be homotopic maps. Then the two induced maps

$$KU(f) = KU(g) : KU(Y) \to KU(X)$$

are equal.

Proposition 1.3.5

Let X_1, \ldots, X_n be compact Hausdorff spaces. Then there is an isomorphism

$$K(X_1) \times \cdots \times K(X_n) \cong K(X_1) \oplus \cdots \oplus K(X_n)$$

Definition 1.3.6: Reduced Complex K-Theory

Let X be a compact Hausdorff space. Define the reduced complex K-theory of X to be the cokernel

$$\widetilde{KU}(X) = \operatorname{coker}(KU(*) \to KU(X))$$

Proposition 1.3.7

Let *X* be a compact Hausdorff space. Then the following sequence

$$0 \longrightarrow KU(*) = \mathbb{Z} \longrightarrow KU(X) \longrightarrow \widetilde{KU}(X) \longrightarrow 0$$

is split exact. In particular, there is an isomorphism

$$KU(X) \cong \widetilde{KU}(X) \oplus \mathbb{Z}$$

Proposition 1.3.8

Let X,Y be compact Hausdorff spaces. Let $f,g:X\to Y$ be homotopic maps. Then the two induced maps

$$\widetilde{KU}(f) = \widetilde{KU}(g) : \widetilde{KU}(Y) \to \widetilde{KU}(X)$$

are equal.

2 Bott Periodicity Theorem

2.1 The Main Theorem

Theorem 2.1.1: Complex Bott Periodicty Theorem

There are homotopy equivalences

$$\Omega^2 BU \simeq \mathbb{Z} \times BU \quad \text{ and } \quad \Omega^2 U \simeq U$$

2.2 Connections to K-Theory

Proposition 2.2.1

Let X be a compact Hausdorff space. Then there are natural isomorphisms

$$\widetilde{KU}(X)\cong [X,BU] \quad \text{ and } \quad KU(X)\cong [X,BU\times \mathbb{Z}]$$

Simplifying Generators of an Ideal 3

Ordering on the Monomials

Recall that a monomial in $R[x_1,\ldots,x_n]$ is an element in the polynomial ring of the form $x_1^{a_1}\cdots x_n^{a_n}$. For simplicity we write this as $x^{(a_1,\dots,a_n)}$.

Definition 3.1.1: Monomial Ordering

A monomial ordering on a polynomial ring $k[x_1,\ldots,x_n]$ is a relation > on \mathbb{N}^n . This means that the following are true.

- > is a total ordering on \mathbb{N}^n
- If a > b and $c \in \mathbb{N}^n$ then a + c > b + c
- > is a well ordering on \mathbb{N}^n (any nonempty subset of \mathbb{N}^n has a smallest element)

Definition 3.1.2: Lexicographical Order

Let $a=(a_1,\ldots,a_n)$ and $b=(b_1,\ldots,b_n)$ in \mathbb{N}^n . We say that $a>_{\mathrm{lex}} b$ if in the first nonzero entry of a - b is positive.

In practise this means that the we value more powers of x_1

Definition 3.1.3: Graded Lex Order

Let $a=(a_1,\ldots,a_n)$ and $b=(b_1,\ldots,b_n)$ in \mathbb{N}^n . We say that $a>_{\mathsf{grlex}} b$ if either of the following

- $\begin{array}{ll} \bullet & |a| = \sum_{k=1}^n a_k > \sum_{k=1}^n b_k = |b| \\ \bullet & |a| = |b| \text{ and } a >_{\operatorname{lex}} b \end{array}$

Definition 3.1.4: Graded Lex Order

Let $a=(a_1,\ldots,a_n)$ and $b=(b_1,\ldots,b_n)$ in \mathbb{N}^n . We say that $a>_{\mathsf{grlex}} b$ if either of the following

- $|a| = \sum_{k=1}^{n} a_k > \sum_{k=1}^{n} b_k = |b|$ |a| = |b| and the last nonzero entry of a-b is negative.

In practise we value lower powers of the last variable x_n .

Proposition 3.1.5

The above three orders are all monomial orderings of $k[x_1, \ldots, x_n]$.

Definition 3.1.6: Multidegree

Let $f \in k[x_1,\ldots,x_n]$ be a polynomial in the form $f = \sum_{v \in \mathbb{N}^n} c_v x^v$. Define the multidegree of

$$\mathrm{multideg}(f) = \max\{v \in \mathbb{N}^n | a_v \neq 0\}$$

where > is a monomial ordering on $k[x_1, \ldots, x_n]$.

Definition 3.1.7: Leading Objects

Let $f \in k[x_1, \dots, x_n]$ be a polynomial in the form $f = \sum_{v \in \mathbb{N}^n} c_v x^v$.

- Define the leading coefficient of f to be $LC(f) = c_{\text{multideg}(f)} \in k$
- Define the leading monomial of f to be $LM(f) = c_{multideg(f)} \in k$
- Define the leading term of f to be $LT = LC(f) \cdot LM(f)$

Proposition 3.1.8: Division Algorithm in $k[x_1, \ldots, x_n]$

3.2 Monomial Ideals

Definition 3.2.1: Monomial Ideals

An ideal $I \subset k[x_1, \dots, x_n]$ is said to be a monomial ideal if I is generated by a set of monomials $\{x^v|v\in A\}$ for some $A\subset \mathbb{N}^n$. In this case we write

$$I = \langle x^v | v \in A \rangle$$

Lemma 3.2.2

Let $I = \langle x^v | v \in A \rangle$ be an ideal of $k[x_1, \dots, x_n]$. Then a monomial x^w lies in I if and only if $x^v | x^w$ for some $v \in A$. Moreover, if $f = \sum_{w \in \mathbb{N}^n} c_w x^w \in k[x_1, \dots, x_n]$ lies in I, then each x^w is divisible by x^v for some $v \in A$.

Theorem 3.2.3: Dickson's Lemma

Every monomial ideal is finitely generated. In particular, every monomial ideal $I=\langle x^v|v\in A\rangle$ is of the form

$$I = \langle x^{v_1}, \dots, x^{v_n} \rangle$$

where $v_1, \ldots, v_n \in A$.

3.3 Groebner Bases

4 Smooth Algebras

4.1 Smooth Algebras

Definition 4.1.1: Smooth Algebra

Let A be a commutative algebra over a field k. We say that A is a smooth algebra over k if $\Omega^1_{A/k}$ is a projective A-module.

Definition 4.1.2: Formal Smoothness

Let A be a commutative algebra over a field k. We say that A is a formally smooth if for every k-algebra C together with a k-algebra homomorphism $u:A\to C/N$ where $N^2=0$, there exists a k-algebra map $v:A\to C$ such that the following diagram is commutative:

$$A \xrightarrow{-\stackrel{\exists v}{-}} C$$

$$\downarrow \iota \qquad \qquad \downarrow \iota$$

$$\frac{C}{N}$$

We say that A is etale over k if such a map $v: A \to C$ is unique.

5 Geometric Properties of Ring Homomorphisms

5.1 Finite and Quasi-Finite Morphisms

Definition 5.1.1: Finite Morphisms

Let $f: R \to S$ be a commutative ring homomorphism. We say that f is a finite morphism if S is a finitely generated R-module.

Note: An algebra A over a ring R is finite over R if A is finitely generated as an R-module.

Note: For R a ring and p a prime ideal, the residue field is defined as

$$k(p) = \frac{R_p}{pR_p}$$

Definition 5.1.2: Quasi-Finite Morphisms

Let $f: R \to S$ be a commutative ring homomorphism. We say that f is a quasi-finite morphism if for all prime ideals $q \subset S$ and $p = f^{-1}(q)$, the algebra

$$\frac{S_q}{pS_q}$$

is finitely generated as an $k(p) = \frac{R_p}{pR_p}$ -module.

5.2 Unramified Morphisms

Recall that a local homomorphism consists of a homomorphism of local rings $f:R\to S$ such that $m_RS\subseteq m_S$

Definition 5.2.1

Let $(R, m_R, k(R))$ and $(S, m_S, k(S))$ be local rings. Let $f: R \to S$ be a local homomorphism of local rings. We say that f is unramified if the following are true.

- $m_R S = m_S$
- ullet The field extension $k(R) \to k(S)$ is finite and separable

Lemma 5.2.2

Every unramified morphism is quasi-finite.

Note: Zariski's main theorem

Proposition 5.2.3

Let $f:A\to B$ be a unramified local ring homomorphism such that B is the localization of a finitely generated A-algebra. Then B is the localization of an A-algebra B_0 that is a finitely generated A-module.

5.3 Etale Morphisms

Definition 5.3.1

Let $f:R\to S$ be a homomorphism of commutative rings. We say that f is etale if the following are true.

- ullet S is a finitely generated R-algebra
- ullet S is a flat R-module
- \bullet f is unramified.

In this case, we say that S is etale over R, or we say that S is an etale R-algebra.

Corollary 5.3.2

Let $f: R \to S$ be an etale homomorphism. Then B is the localization of an A-algebra B_0 that is a finitely generated A-module.

Proof. We have already proved this for every every unramified ring homomorphism and every etale homomorphism is also unramified.

Proposition 5.3.3

Let A be a k-algebra for a field k. Then $k \to A$ is an etale morphism if and only if A is isomorphic to the product of finitely many finite separable field extensions of k.

Proposition 5.3.4

Let $f:A\to B$ be a finitely generated flat algebra. Then f is etale if and only if for every prime ideal $p\subset A$, the algebra

$$B\otimes_A k(p)$$

is etale over k(p).

Note: We say that a local homomorphism $f:A\to B$ is finitely generated if B is the localization of a finitely generated A-algebra.

6 Derived Categories in Algebraic Geometry

6.1 Derived Categories of Schemes

Definition 6.1.1: Derived Category of a Scheme

Let X be a scheme. Define the derived category to be

$$D^*(X) = D^*(\mathbf{Coh}(X))$$

where * can be b, +, - or null.

Definition 6.1.2: Derived Equivalences

Let X,Y be a schemes over a field k. We say that X and Y are derived equivalent if there exists a k-linear exact equivalence

$$D^b(X) \cong D^n(Y)$$

Let *X* be a scheme. Then there is a natural inclusion of categories

$$\mathbf{Coh}(X) \subset \mathbf{QCoh}(X) \subset \mathbf{Mod}_{O_X}$$

Proposition 6.1.3

Let X be a noetherian scheme. Suppose that *=b,+,-. Then there are natural equivalences

$$D^*(\mathbf{QCoh}(X)) \cong D^*_{\mathbf{QCoh}(X)}(\mathbf{Mod}_{O_X})$$

Proposition 6.1.4

Let *X* be a noetherian scheme. Then the inclusion functor induces

$$D^b(X) \to D^b(\mathbf{QCoh}(X))$$

which defines an equivalence of categories between $D^b(X)$ and $D^b_{\mathbf{Coh}(X)}(\mathbf{QCoh}(X)).$

7 Intersection Theory

Scheme = scheme + morphism of finite type to Spec(k) Variety = Irreducible variety subvariety = closed subscheme of a variety which is a variety point = closed point

7.1 The Order of Zeroes and Poles

Recall that when we defined the notion of Weil divisors, we restricted ourselves to the case where X is a Noetherian separated scheme that is regular in codimension 1. This is because we wanted to make use of the fact that $\mathcal{O}_{X,\eta}$ is a discrete valuation ring for η a generic point of any irreducible subscheme of codimension 1 of X. In general when X is Noetherian, $\mathcal{O}_{X,\eta}$ is only a local Noetherian ring. In order to define a notion of order for every element in $K(X) = \mathcal{O}_{X,\eta}$, we need a new definition.

Definition 7.1.1: Order of Functions in the Function Field

Let X be an irreducible variety. Let Y be a subvariety of codimension 1 and let η be its generic point. For every $r \in \mathcal{O}_{X,\eta}$, define

$$\operatorname{ord}_Y(r) = \operatorname{length}_{\mathcal{O}_{X,\eta}} \left(\frac{\mathcal{O}_{X,\eta}}{(r)} \right)$$

For every $r = ab^{-1} \in \operatorname{Frac}(\mathcal{O}_{X,\eta}) = K(X)$, define

$$\operatorname{ord}_Y(r) = \operatorname{ord}_Y(a) - \operatorname{ord}_Y(b)$$

Beware that $\mathcal{O}_{X,\eta}$ is not the function field of X. This is because η is the generic point of Y, not the generic point of X. And generic points do not coincide for subvarieties and varieties.

Lemma 7.1.2

Let X be an irreducible variety. Let Y be a subvariety of codimension 1 and let η be its generic point. Then the function $\operatorname{ord}_Y: K(X)^* \to \mathbb{Z}$ is a group homomorphism.

Definition 7.1.3: k-Cycles on a Variety

Let X be an irreducible variety. Define the group of k-cycles to be free abelian group

$$Z_k(X) = \mathbb{Z}\langle V \mid V \text{ is a } k\text{-dimensional subvariety of } X\rangle$$

generated by k-dimensional subvarieties of X.

Definition 7.1.4: Divisors of a Function

Let X be an irreducible variety. Let W be a (k + 1)-dimensional subvariety of X. For any $r \in K(X)$, define

$$\operatorname{div}(r) = \sum_{\operatorname{codim}_W(V) = 1} \operatorname{ord}_V(r) \cdot [V]$$

where $\operatorname{ord}_V: K(W)^* \to \mathbb{Z}$.

Definition 7.1.5: Rational Equivalence

Let X be an irreducible variety. Let α and β be k-cycles. We say that α and β are rationally equivalent, denoted by $\alpha \sim_{\mathsf{rat}} \beta$ if there exists a finite number of (k+1)-dimensional subvarieties W_i of X and $r_i \in K(W_i)^*$ such that

$$\alpha - \beta = \sum_{i} [\operatorname{div}(r_i)] \cdot W_i$$

Theorem 7.1.6

Let X be an irreducible variety. Let α and β be k-cycles. Then α and β are rationally equivalent if and only if there are (k+1)-dimensional subvarieties V_1,\ldots,V_t of the Cartesian product $X\times\mathbb{P}^1$ such that the projections $f_i:V_i\to\mathbb{P}^1$ are dominant and

$$\alpha - \beta = \sum_{k=1}^{t} [V_i(0)] - [V_i(\infty)]$$

in $Z_k(X)$. Here, $V_i(P)$ is the subscheme of X where the projection $X \times \{P\} \to X$ maps the subscheme $f^{-1}(P)$ isomorphically to, for P a point in \mathbb{P}^1 .

Definition 7.1.7: The Chow Group

Let X be an irreducible variety. Define

$$\operatorname{CH}_k(X) = \frac{Z_k(X)}{\sim_{\mathsf{rat}}}$$

for each $k \in \mathbb{N}$. Also define

$$Z_*(X) = \bigoplus_{k=0}^{\dim(X)} Z_k(X) \quad \text{ and } \quad \operatorname{CH}_*(X) = \bigoplus_{k=0}^{\dim(X)} A_k(X)$$

7.2 The Induced Map

Definition 7.2.1: Degree of Subvariety

Let X,Y be irreducible varieties. Let $f:X\to Y$ be a proper morphism. Let V be a subvariety of X and let W=f(V) be the corresponding subvariety of Y. Define the degree of V over W by

$$\deg(V/W) = \begin{cases} [k(V):k(W)] & \text{if } \dim(W) = \dim(V) \\ 0 & \text{if } \dim(W) < \dim(V) \end{cases}$$

Notice that this definition makes sense. Since $f: X \to Y$ is proper, W = f(V) becomes a subvariety of Y. Such a map induces a map of fields $k(W) \to k(V)$ which is necessarily injective. From field theory we know that such a map is injective and in particular k(V) is a vector space over k(W).

Definition 7.2.2: The Pushfoward Map

Let X,Y be irreducible varieties. Let $f:X\to Y$ be a proper morphism. Define the pushforward of f by $f_*:Z_k(X)\to Z_k(Y)$ where

$$f_*([V]) = \deg(V/W)[W]$$

for V a closed subvariety of X and W = f(V).

Lemma 7.2.3: Functorial Properties of the Pushforward Map

Let X,Y,Z be irreducible varieties. Let $f:X\to Y$ and $g:Y\to Z$ be proper morphisms. Then the following are true.

- $\bullet \ (g \circ f)_* = g_* \circ f_*$
- $\bullet \ (\mathrm{id}_X)_* = \mathrm{id}_{Z_k(X)}$

TBA: Z_* : IrrVar $_k \to \mathbf{GrAb}$ is a covariant functor.

Theorem 7.2.4

Let X,Y be irreducible varieties. Let $f:X\to Y$ be a proper morphism. Let α be a k-cycle on X that is rationally equivalent to 0. Then $f_*(\alpha)$ is also rationally equivalent to 0.

TBA: $A_*: \operatorname{IrrVar}_k \to \mathbf{GrAb}$ is a covariant functor.

8 Symmetric Polynomials

8.1 Symmetric Polynomials

The theory of symmetric functions are important in combinatorics, representation theory, Galois theory and the theory of λ -rings.

Requirements: Groups and Rings Books: Donald Yau: Lambda Rings

Definition 8.1.1: Symmetric Group Action on Polynomial Rings

Let R be a ring. Define a group action of S_n on $R[x_1, \ldots, x_n]$ by

$$\sigma \cdot f(x_1, \dots, x_n) = f(x_{\sigma(1)}, \dots, x_{\sigma(n)})$$

It is easy to check that this defines a group action.

Definition 8.1.2: Symmetric Polynomials

Let R be a ring. We say that a polynomial $f \in R[x_1, ..., x_n]$ is symmetric if

$$\sigma \cdot f = f$$

for all $\sigma \in S_n$.

Definition 8.1.3: The Ring of Symmetric Polynomials

Let R be a ring. Define the ring of symmetric polynomials in n variables over R to be the set

$$\Sigma = \{ f \in R[x_1, \dots, x_n] \mid \sigma \text{ is a symmetric polynomial } \}$$

Definition 8.1.4: Elementary Symmetric Polynomials

Let R be a ring. Define the elementary symmetric polynomials to be the elements $s_1, \ldots, s_n \in R[x_1, \ldots, x_n]$ given by the formula

$$s_k(x_1, \dots, x_n) = \sum_{1 \le i_1 \le \dots \le i_k \le n} x_{i_1} \cdots x_{i_k}$$

Theorem 8.1.5: The Fundamental Theorem of Symmetric Polynomials

Let R be a ring. Then s_1, \ldots, s_n are algebraically independent over R. Moreover,

$$\Sigma = R[s_1, \dots, s_n]$$

9 λ -Rings

λ -Rings 9.1

Complex representation of a group is a λ -ring. Topological K theory is a λ -ring.

Requirements: Category Theory, Groups and Rings, Symmetric Functions

Books: Donald Yau: Lambda Rings

We need the theory of symmetric polynomials before defining λ -structures.

Definition 9.1.1: λ **-Structures**

Let R be a commutative ring. A λ -structure on R consists of a sequence of maps $\lambda^n:R\to R$ for $n \ge 0$ such that the following are true.

- $\bullet \ \ \lambda^0(r)=1 \ \text{for all} \ r\in R$
- $\lambda^1 = id_R$
- $\lambda^n(1) = 0$ for all $n \ge 2$
- $\begin{array}{l} \bullet \ \ \lambda^n(r+s) = \sum_{k=0}^n \overline{\lambda^k}(r) \lambda^{n-k}(s) \ \text{for all} \ r,s \in R \\ \bullet \ \ \lambda^n(rs) = P_n(\lambda^1(r),\ldots,\lambda^n(r),\lambda^1(s),\ldots,\lambda^n(s)) \ \text{for all} \ r,s \in R \end{array}$
- $\lambda^m(\lambda^n(r)) = P_{m,n}(\lambda^1(r), \dots, \lambda^{mn}(r))$ for all $r \in R$

Here P_n and $P_{m,n}$ are defined as follows.

• The coefficient of t^n in the polynomial

$$h(t) = \prod_{i,j=1}^{n} (1 + x_i y_j t)$$

is a symmetric polynomial in x_i and y_j with coefficients in \mathbb{Z} . P_n is precisely this polynomial written in terms of the elementary polynomials e_1, \ldots, e_n and f_1, \ldots, f_n of x_i and y_i respectively.

• The coefficient of t^n in the polynomial

$$g(t) = \prod_{1 \le i_1 \le \dots \le i_m \le nm} (1 + x_{i_1} \dots x_{i_m} t)$$

is a symmetric polynomial in x_i with coefficients in \mathbb{Z} . $P_{m,n}$ is precisely this polynomial written in terms of the elementary polynomials e_1, \ldots, e_n of x_i . In this case, we call R a λ -ring.

Note that we do not require that the λ^n are ring homomorphisms.

Definition 9.1.2: Associated Formal Power Series

Let R be a λ -ring. Define the associated formal power series to be the function $\lambda_t:R\to$ R[[t]] given by

$$\lambda_t(r) = \sum_{k=0}^{\infty} \lambda^k(r) t^k$$

for all $r \in R$

Proposition 9.1.3

Let R be a λ -ring. Then the following are true regarding $\lambda_t(r)$.

- $\lambda_t(1) = 1 + t$
- $\lambda_t(0) = 1$
- $\lambda_t(r+s) = \lambda_t(r)\lambda_t(s)$
- $\lambda_t(-r) = \lambda(r)^{-1}$

Proposition 9.1.4

The ring \mathbb{Z} has a unique λ -structure given by

$$\lambda_t(n) = (1+t)^n$$

Proposition 9.1.5

Let R be a λ -ring. Then R has characteristic 0.

Definition 9.1.6: Dimension of an Element

Let R be a λ -ring and let $r \in R$. We say that r has dimension n if $\deg(\lambda_t(r)) = n$. In this case, we write $\dim(r) = n$.

Proposition 9.1.7

Let R be a λ -ring. Then the following are true regarding the dimension of n.

- $\dim(r+s) \leq \dim(r) + \dim(s)$ for all $r, s \in R$
- If r and s both has dimension 1, then so is rs.

9.2 λ -Ring Homomorphisms and Ideals

Definition 9.2.1: λ **-Ring Homomorphisms**

Let R and S be λ -rings. A λ -ring homomorphism from R to S is a ring homomorphism $f:R\to S$ such that

$$\lambda^n \circ f = f \circ \lambda^n$$

for all $n \in \mathbb{N}$.

Definition 9.2.2: λ **-Ideals**

Let R be a λ -ring. A λ -ideal of R is an ideal I of R such that

$$\lambda^n(i) \in I$$

for all $i \in I$ and $n \ge 1$.

TBA: λ -ideal and subring. Ker, Im, Quotient Product, Tensor, Inverse Limit are λ -rings

Proposition 9.2.3

Let R be a λ -ring. Let $I=\langle z_i\mid i\in I\rangle$ be an ideal in R. Then I is a λ -ideal if and only if $\lambda^n(z_i)\in I$ for all $n\geq 1$ and $i\in I$.

Proposition 9.2.4

Every λ -ring R contains a λ -subring isomorphic to \mathbb{Z} .

9.3 Augmented λ -Rings

Definition 9.3.1: Augmented λ **-Rings**

Let R be a λ -ring. We say that R is an augmented λ -ring if it comes with a λ -homomorphism

$$\varepsilon:R\to\mathbb{Z}$$

called the augmentation map.

TBA: tensor of augmented is augmented

Proposition 9.3.2

Let R a λ -ring. Then R is augmented if and only if there exists a λ -ideal I such that

$$R = \mathbb{Z} \oplus I$$

as abelian groups.

9.4 Extending λ -Structures

Proposition 9.4.1

Let R be a λ -ring. Then there exists a unique λ -structure on R[x] such that $\lambda_t(r) = 1 + rt$. Moreover, if R is augmented, then so is R[x] and $\varepsilon(r) = 0$ or 1.

Proposition 9.4.2

Let R be a λ -ring. Then there exists a unique λ -structure on R[[x]] such that $\lambda_t(r) = 1 + rt$. Moreover, if R is augmented, then so is R[[x]] and $\varepsilon(r) = 0$ or 1.

- 9.5 Free λ -Rings
- 9.6 The Universal λ -Ring
- 9.7 Adams Operations

10 Witt Vectors

10.1 Fundamentals of the Ring of Big Witt Vectors

Prelim: Symm Functions, Lambda Rings, Category theory, Frobenius endomorphism (Galois), Rings and Modules, Kaehler differentials (commutative algebra 2)

Leads to: K theory

Books: Donald Yau: Lambda Rings

Definition 10.1.1: Truncation Sets

Let $S \subseteq \mathbb{N}$. We say that S is a truncation set if for all $n \in S$ and d|n, then $d \in S$. For $n \in \mathbb{N}$ and S a truncation set, define

$$S/n = \{d \in \mathbb{N} \mid nd \in S\}$$

For instance, $\mathbb{N} \setminus \{0\}$ is a truncation set. We will also use $\{1, \dots, n\}$.

Theorem 10.1.2: Dwork's Theorem

Let R be a ring and let S be a truncation set. Suppose that for all primes p, there exists a ring endomorphism $\sigma_p: R \to R$ such that $\sigma_p(r) \equiv r^p \pmod{pR}$ for some $s \in R$. Then the following are equivalent.

• Every element $(b_i)_{i \in S} \in \prod_{i \in S} R$ has the form

$$(b_i)_{i \in S} = (w_i(a))_{i \in S}$$

for some $a \in R$

• For all primes p and all $n \in S$ such that p|n, we have

$$b_n \equiv \sigma_p(b_{n/p}) \pmod{p^n R}$$

In this case, a is unique, and a_n depends solely on all the b_k for $1 \le k \le n$ and $k \in S$.

We wish to equip $\prod_{i \in S} R$ with a non-standard addition and multiplication to make it into a ring.

Proposition 10.1.3

Consider the ring $R = \mathbb{Z}[x_i, y_i \mid i \in S]$. There exists unique polynomials

$$\xi_n(x_1,\ldots,x_n,y_1,\ldots,y_n), \pi_n(x_1,\ldots,x_n,y_1,\ldots,y_n), \iota_n(x_1,\ldots,x_n)$$

for $n \in S$ such that

- $w_n(\xi_1, \dots, \xi_n) = w_n((x_i)_{i \in S}) + w_n((y_i)_{i \in S})$
- $w_n(\pi_1, ..., \pi_n) = w_n((x_i)_{i \in S}) \cdot w_n((y_i)_{i \in S})$
- $w_n(\iota_1,\ldots,\iota_n) = -w_n((x_i)_{i\in S})$

for all $n \in S$.

Note that the polynomials ξ_n , π_n have variables x_k and y_k for $k \leq n$ and $k \in S$. This is similar for the variables of ι . From now on, this will be the convention: For S a truncation set, the sequence a_1, \ldots, a_n actually refers to the sequence $a_1, a_{d_1}, \ldots, a_{d_k}, a_n$ where $1 \leq d_1 \leq \cdots \leq d_k \leq n$ and d_1, \ldots, d_k are all divisors of n. The result of this is that sequences in $\mathbb N$ are now restricted to S.

Definition 10.1.4: The Ring of Truncated Witt Vector

Let R be a ring. Let S be a truncation set. Define the ring of big Witt vectors $W_S(R)$ of R to consist of the following.

- The underlying set $\prod_{i \in S} R$
- Addition defined by $(a_n)_{n\in S} + (b_n)_{n\in S} = (\xi_n(a_1,\ldots,a_n,b_1,\ldots,b_n))_{n\in\mathbb{N}}$
- Multiplication defined by $(a_n)_{n \in S} \times (b_n)_{n \in S} = (\pi_n(a_1, \dots, a_n, b_1, \dots, b_n))_{n \in \mathbb{N}}$

Theorem 10.1.5

Let R be a ring. Let S be a truncation set. Then the ring of big Witt vectors $W_S(R)$ of R is a ring with additive identity $(0,0,\ldots)$ and multiplicative identity $(1,0,0,\ldots)$. Moreover, for $(a_n)_{n\in S}\in W(R)$, its additive inverse is given by $(\iota_n(a_1,\ldots,a_n))_{n\in \mathbb{N}}$.

Proposition 10.1.6

Let $\phi: R \to R'$ be a ring homomorphism. Then the induced map $W_S(\phi): W_S(R) \to W_S(R')$ defined by

$$W(\phi)((a_n)_{n\in S}) = (\phi(a_n))_{n\in S}$$

is a ring homomorphism.

Definition 10.1.7: The Witt Functor

Define the Witt functor $W_S : \mathbf{Ring} \to \mathbf{Ring}$ to consist of the following data.

- For each ring R, $W_S(R)$ is the ring of big Witt vectors
- For a ring homomorphism $\phi: R \to R'$, $W_S(\phi): W_S(R) \to W_S(R')$ is the induced ring homomorphism defined by

$$W_S(\phi)((a_n)_{n\in S}) = (\phi(a_n))_{n\in S}$$

Proposition 10.1.8

Let S be a truncation set. The Witt functor is indeed a functor.

Definition 10.1.9: The Ghost Map

Let R be a ring. Let S be a truncation set. Define the ghost map to be the map

$$w:W_S(R)\to\prod_{k\in S}R$$

by the formula

$$w((a_n)_{n \in S}) = (w_n(a_1, \dots, a_n))_{n \in S}$$

Remember, by the sequence a_1, \ldots, a_n we mean the sequence $a_1, a_{d_1}, \ldots, a_{d_k}, a_n$ where $1 \le d_1 \le \cdots \le d_k \le n$ and d_1, \ldots, d_k the complete collection of divisors of n.

Proposition 10.1.10

Let *S* be a truncation set. Then the following are true.

- For each $n \in S$, the collection of maps $w_n : W_S(R) \to R$ for a ring R defines a natural transformation $w_n : W_S \to \mathrm{id}$.
- The collection of ghost maps $w_R:W_S(R)\to\prod_{k\in S}R$ for R a ring defines a natural transformation $w:W_S\to(-)^S$.

Proposition 10.1.11

Let S be a truncation set. The truncated Witt functor $W_S : \mathbf{Ring} \to \mathbf{Ring}$ is uniquely characterized by the following conditions.

- The underlying set of $W_S(R)$ is given by $\prod_{k \in S} R$
- For a ring homomorphism $\phi: R \to S$, $W(\phi): W(R) \to W(S)$ is the induced ring homomorphism defined by

$$W(\phi)((a_n)_{n\in\mathbb{N}}) = (\phi(a_n))_{n\in\mathbb{N}}$$

• For each $n \in S$, $w_n : W_S(R) \to R$ defines a natural transformation $w_n : W \to \mathrm{id}$ This means that if there is another functor V satisfying the above, then W and V are naturally isomorphic.

Note that the above theorem implies that the ring structure on $\prod_{k \in S} R$ is unique under the above conditions.

10.2 Important Maps of Witt Vectors

Definition 10.2.1: The Forgetful Map

Let R be a ring. Let $T \subseteq S$ be truncation sets. Define the forgetful map $R_T^S: W_S(R) \to W_T(R)$ to be the ring homomorphism given by forgetting all elements $s \in S$ but $s \notin T$.

Definition 10.2.2: The *n*th Verschiebung Map

Let R be a ring. Let S be a truncation set. For $n \in \mathbb{N}$, define the nth Verschiebung map $V_n: W_{S/n}(R) \to W_S(R)$ by

$$V_n((a_d)_{d \in S/n})_m = \begin{cases} a_d & \text{if } m = nd \\ 0 & \text{otherwise} \end{cases}$$

Note that this is not a ring homomorphism. However, it is additive.

Lemma 10.2.3

Let R be a ring. Let S be a truncation set. Then for all $a,b \in W_{S/n}(R)$, we have that

$$V_n(a+b) = V_n(a) + V_n(b)$$

Definition 10.2.4: Frobenius Map

Let S be a truncation set. Let R be a ring. Define the Frobenius map to be a natural ring homomorphism $F_n:W_S(R)\to W_{S/n}(R)$ such that the following diagram commutes:

$$W_{S}(R) \xrightarrow{w} \prod_{k \in S} R$$

$$\downarrow^{F_{n}} \qquad \qquad \downarrow^{F_{n}^{w}}$$

$$W_{S/n}(R) \xrightarrow{w} \prod_{k \in S/n} R$$

if it exists.

Lemma 10.2.5

Let S be a truncation set. Let R be a ring. Then the Frobenius map exists and is unique.

The following lemma relates this notion of Frobenius map to that in ring theory.

Lemma 10.2.6

Let A be an F_p algebra. Let S be a truncation set. Let $\varphi_p:A\to A$ denote the Frobenius homomorphism given by $a\mapsto a^p$. Then

$$F_p = R_{S/p}^S \circ W_S(\varphi) : W_S(A) \to W_{S/p}(A)$$

Definition 10.2.7: The Teichmuller Representative

Let R be a ring. Let S be a truncation set. Define the Teichmuller representative to be the map $[-]_S: R \to W_S(R)$ defined by

$$([a]_S)_n = \begin{cases} a & \text{if } n = 1\\ 0 & b \text{ otherwise} \end{cases}$$

The Teichmuller representative is in general not a ring homomorphism, but it is still multiplicative.

Lemma 10.2.8

Let R be a ring. Let S be a truncation set. The for all $a,b\in R$, we have that

$$[ab]_S = [a]_S \cdot [b]_S$$

The three maps introduced are related as follows.

Proposition 10.2.9

Let R be a ring. Let S be a truncated set. Then the following are true.

- $r = \sum_{n \in S} V_n([r_n]_{S/n})$ for all $r \in W_S(R)$
- $F_n(V_n(a)) = na$ for all $a \in W_{S/n}(R)$
- $r \cdot V_n(a) = V_n(F_n(r) \cdot a)$ for all $r \in W_S(R)$ and all $a \in W_{S/n}(R)$
- $F_m \circ V_n = V_n \circ F_m$ if gcd(m, n) = 1

The remaining section is dedicated to the example of $R = \mathbb{Z}$.

Proposition 10.2.10

Let S be a truncation set. Then the ring of big Witt vectors of \mathbb{Z} is given by

$$W_S(\mathbb{Z}) = \prod_{n \in S} \mathbb{Z} \cdot V_n([1]_{S/n})$$

with multiplication given by

$$V_m([1]_{S/m}) \cdot V_n([1]_{S/n}) = \gcd(m, n) \cdot V_d([1]_{S/d})$$

and d = lcm(m, n).

10.3 The Ring of p-Typical Witt Vectors

For the ring of p-typical Witt vectors, we consider the truncation set $P = \{1, p, p^2, \dots\} \subseteq \mathbb{N}$ for a prime p.

Definition 10.3.1: The Ring of p-Typical Witt Vectors

Let R be a ring. Let p be a prime. Let $P=\{1,p,p^2,\dots\}\subseteq \mathbb{N}$. Define the ring of p-typical Witt vectors to be

$$W_p(R) = W_P(R)$$

Define the ring of p-typical Witt vectors of length n to be

$$W_n(R) = W_{\{1,p,\dots,p^{n-1}\}}(R)$$

when the prime p is understood.

Theorem 10.3.2

Let R be a ring. Let p be a prime number. Let S be a truncation set. Write $I(S) = \{k \in S \mid k \text{ does not divide } p\}$. Suppose that all $k \in I(S)$ are invertible in R. Then there is a decomposition

$$W_S(R) = \prod_{k \in I(S)} W_S(R) \cdot e_k$$

where

$$e_k = \prod_{t \in I(S) \setminus \{1\}} \left(\frac{1}{k} V_k([1]_{S/k}) - \frac{1}{kt} V - kt([1]_{S/kt}) \right)$$

Moreover, the composite map given by

$$W_S(R) \cdot e_k \longleftrightarrow W_S(R) \xrightarrow{F_k} W_{S/k}R \xrightarrow{R_{S/k\cap P}^{S/k}} W_{S/k\cap P}(R)$$

is an isomorphism.

10.4 The λ -structure on W(R)

Lemma 10.4.1

Let R be a ring. Then every $f \in \Lambda(R)$ can be written uniquely as

$$f = \prod_{k=1}^{\infty} (1 - (-1)^n a_n t^n)$$

Theorem 10.4.2: The Artin-Hasse Exponential

There is a natural isomorphism $E:\Lambda\to W$ given as follows. For a ring $R,E_R:\Lambda(R)\to W(R)$ is defined by

$$E_R\left(\prod_{k=1}^{\infty} (1-(-1)^n a_n t^n)\right) = (a_n)_{n \in \mathbb{N}}$$

Corollary 10.4.3

Let R be a ring. Then W(R) has a canonical λ -structure inherited from $\Lambda(R)$.

TBA: The forgetful functor $U: \Lambda \mathbf{Ring} \to \mathbf{CRing}$ has a left adjoint Symm and has a right adjoint W.

11 Formal Group Laws

Definition 11.0.1: Formal Group Laws

Let R be a ring. A formal group law over R is a power series

$$f(x,y) \in R[[x,y]]$$

such that the following are true.

- f(x,0) = f(0,x) = x
- $\bullet \ f(x,y) = f(y,x)$
- f(x, f(y, z)) = f(f(x, y), z)

Definition 11.0.2: The Formal Group Law Functor

Define the formal group law functor

$$FGL : \mathbf{Ring} \to \mathbf{Set}$$

by the following data.

- For each ring R, FGL(R) is the set of all formal group laws over R
- For each ring homomorphism $f: R \to S$, FGL(f) sends each formal group law $\sum_{i,j=0}^{\infty} c_{i,j} x^i y^j$ over R to the formal group law $\sum_{i,j=0}^{\infty} f(c_{i,j}) x^i y^j$ over S.

Definition 11.0.3: The Lazard Ring of a Formal Group Law

Define the lazard ring by

$$L = \frac{\mathbb{Z}[c_{i,j}]}{O}$$

where Q is the ideal generated as follows. Write $f = \sum_{i,j=0}^{\infty} c_{i,j} x^i y^j$. Then Q is generated by the constraints on $c_{i,j}$ for which f becomes a formal group law.

Lemma 11.0.4

The Lazard ring $L = \mathbb{Z}[c_{i,j}]/Q$ has the structure of a graded ring where $c_{i,j}$ has degree 2(i + j - 1).

Theorem 11.0.5

The formal group law functor $FGL : \mathbf{Ring} \to \mathbf{Set}$ is representable

$$FGL(R) \cong \operatorname{Hom}_{\mathbf{Ring}}(L,R)$$

There exists a universal element $f \in L$ such that the map $\operatorname{Hom}_{\mathbf{Ring}}(L,R) \to FGL(R)$ given by evaluation on f is a bijection for any ring R.

Theorem 11.0.6

There is an isomorphism of the Lazard ring

$$L \cong \mathbb{Z}[t_1, t_2, \dots]$$

where each t_k has degree 2k.

12 Calculus of Functors

12.1 Excisive Functors

Definition 12.1.1: Homotopy Functors

Let C, D be categories with a notion of weak equivalence. We say that a functor $F : C \to D$ is a homotopy functor if F preserves weak equivalences.

Definition 12.1.2: n-Excisive Functors

Let F be a homotopy functor. We say that F is n-excisive if it takes strongly homotopy cocartesian (n+1)-cubes to homotopy cartesian (n+1)-cubes.

12.2 The Taylor Tower

Definition 12.2.1: Fiberwise Join

Let X,Y,U be spaces. Let $f:X\to Y$ be a map. Define the fiberwise join of X and U along f to be the space

$$X *_{Y} U = (X \longleftarrow X \times U \longrightarrow Y \times U)$$

Lemma 12.2.2

Let X, Y, U, V be spaces. Let $f: X \to Y$ be a map. Then there is a natural isomorphism

$$(X *_Y U) *_Y V \cong X *_Y (U * V)$$

Proposition 12.2.3

Let $\mathcal{P}(n)$ denote the category of posets. Let X be a space over Y. Then the assignment

$$U\mapsto X*_Y U$$

defines an n-dimensional cubical diagram in Top. Moreover, it is strongly cocartesian.

Definition 12.2.4

Let Y be a space. Let $F: \mathbf{Top}_Y \to \mathbf{Top}$ be a homotopy functor. Define the functor

$$T_nF: \mathbf{Top}_V \to \mathbf{Top}$$

to consist of the following data.

• For each $X \in \mathbf{Top}$, consider the functor $\mathcal{X} : \mathcal{P}(n+1) \to \mathbf{Top}$ given by $U \mapsto F(X *_Y U)$. Define

$$T_n F(X) = (\mathcal{X}) =_{U \in \mathcal{P}(n+1)} (F(X *_Y U))$$

• For each $f: X \to Z$ a morphism of spaces over Y, define a map $T_nF(X) \to T_nF(Y)$ to be the map

$$F(f *_{Y} id) \circ \mathcal{X}$$

Lemma 12.2.5

Let Y be a space. Let X be a space over Y. Let F be a homotopy functor. Then T_nF is a homotopy functor.

Proposition 12.2.6

Let F be a homotopy functor. Then there exists a natural map $t_nF: F \Rightarrow T_nF$ given by the canonical map of homotopy limits. Moreover, t_nF is natural in the following sense. If G is another homotopy functor and $\lambda: \mathcal{F} \Rightarrow \mathcal{G}$ is a natural transformation, then the following diagram commutes:

$$F \xrightarrow{\lambda} G$$

$$t_n F \downarrow \qquad \downarrow t_n G$$

$$T_n F \xrightarrow{T_n \lambda} T_n G$$

Definition 12.2.7

Let Y be a space. Let $F: \mathbf{Top}_Y \to \mathbf{Top}$ be a homotopy functor. Define the functor

$$P_nF: \mathbf{Top}_V \to \mathbf{Top}$$

to consist of the following data.

• For each space X over Y, define $P_nF(X)$ to be the homotopy limit

$$P_nF(X) = \text{holim}(F(X) \to T_nF(X) \to (T_n(T_nF))(X) \to \dots)$$

• For each morphism $f: X \to Z$ of spaces over Y, define $P_nF(f): P_nF(X) \to P_nF(Z)$ to be the map ????

Lemma 12.2.8

Let Y be a space. Let X be a space over Y. Let F be a homotopy functor. Then P_nF is a homotopy functor.

Proposition 12.2.9

Let F be a homotopy functor. Then there exists a natural map $p_nF: F \Rightarrow P_nF$ given by the canonical map of homotopy limits. Moreover, p_nF is natural in the following sense. If G is another homotopy functor and $\lambda: \mathcal{F} \Rightarrow \mathcal{G}$ is a natural transformation, then the following diagram commutes:

$$F \xrightarrow{\lambda} G$$

$$p_n F \downarrow \qquad \downarrow p_n G$$

$$P_n F \xrightarrow{P_n \lambda} P_n G$$

Definition 12.2.10: n-Reduced Functors

Let *F* be a homotopy functor. We say that *F* is *n*-reduced if $P_{n-1}F \simeq *$.

Definition 12.2.11: n-Homogenous Functor

Let F be a homotopy functor. We say that F is n-homogenous if F is n-excisive and n-reduced.

12.3 Linear Functors

Definition 12.3.1: Linear Functors

Let F be a homotopy functor. We say that F is linear if F is 1-homogenous. Explicitly, this means that

- F sends homotopy pushouts to homotopy pullbacks
- F(X) is homotopy equivalent to *

Let us consider the case n = 1 and Y = *. Now $\mathcal{P}_0(2)$ is the small category given in a diagram as follows:

$$\begin{cases}
1 \\
\downarrow \\
\{0\} \longrightarrow \{0, 1\}
\end{cases}$$

Now T_1F sends every space X to the homotopy limit of the following diagram:

$$F(X*\{1\})$$

$$\downarrow$$

$$F(X*\{0\}) \longrightarrow F(X*\{0,1\})$$

But we know that $X*\{0\}$ is the cone CX and $X*\{0,1\}$ is the reduced suspension. This means that we can simplify the above diagram into

$$F(CX) \longrightarrow F(\Sigma X)$$

Now $CX \simeq *$ and F is a reduced functor. Thus we can further simplify the diagram into

$$\downarrow \\
 * \longrightarrow F(\Sigma X)$$

We recognize this as the homotopy pullback, and so $T_1F(X) \simeq \Omega F(\Sigma X)$. Now recall that

$$P_1F(X) = (F(X) \overset{t_1F(X)}{\longrightarrow} T_1F(X) \overset{t_1(T_1F)}{\longrightarrow} (T_1(T_1F))(X) \longrightarrow)$$

Again because we know that $T_1F(X)\simeq \Omega F(\Sigma X)$ and we care about everything only up to homotopy, we can write P_1F as

$$P_1F(X) = (F(X) \xrightarrow{t_1F(X)} \Omega F(\Sigma X) \xrightarrow{t_1(T_1F)} \Omega(T_1F)(\Sigma X) \longrightarrow)$$

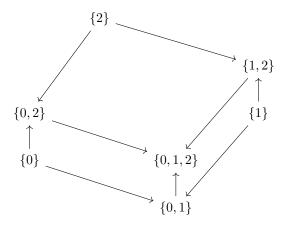

which further simplifies to

$$P_1F(X) = (F(X) \to \Omega F(\Sigma X) \to \Omega^2 F(\Sigma^2 X) \longrightarrow)$$

Thus in general,

$$P_1F(X) =_{n\to\infty} (\Omega^n F(\Sigma^n X))$$

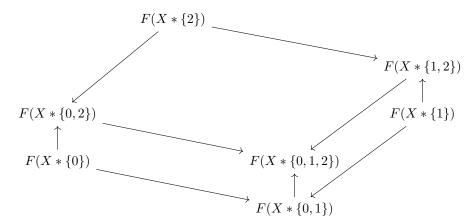

We are considering the case n = 2. Now $\mathcal{P}_0(3)$ is the small category given in a diagram as follows:

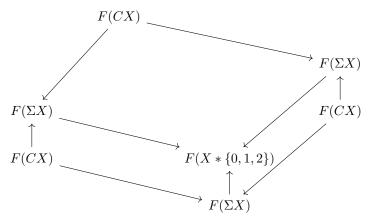

If we plug it into the definition of T_nF and choose Y=*, we obtain a functor

$$T_2F:\mathbf{Top}_* \to \mathbf{Top}$$

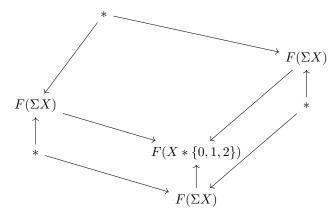

that consists of the following data. For each $X \in \mathbf{Top}$, $T_2F(X)$ is precisely the homotopy limit of the diagram

which simplifies to the diagram:

Now since F is reduced and $CX \simeq *$, we can further simplify it into

(what does the maps look like?)

Definition 12.3.2: The Category of Linear Functors

Define the category

$$\mathcal{H}_1(\mathcal{C},\mathcal{D})$$

of linear functors to be the full subcategory of $\mathcal{D}^{\mathcal{C}}$ consisting of linear functors.

Theorem 12.3.3

There is an equivalence of categories

$$\mathcal{H}_1(\mathbf{CGWH}_*, \mathbf{CGWH}_*) \cong \Omega Sp^{\mathbb{N}}(\mathbf{CGWH}_*)$$

given as follows. For a linear functor F, we associate to it the sequence of spaces $\{F(S^n) \mid n \in \mathbb{N}\}$, and this defines a spectra.

12.4 Catalogue of Construction Needed

Example 12.4.1

 $\mathcal{P}_0(n+1)$ for small values of n is given as follows:

• When n = 0, $\mathcal{P}_0(1)$ consists of only one object

{1}

• When n = 1, $\mathcal{P}_0(2)$ is given by the following diagram:

$$\begin{cases}
1 \\
\downarrow \\
\{0\} \longrightarrow \{0, 1\}
\end{cases}$$

Example 12.4.2: Joins

We consider the join of a space and some finite space with discrete topology.

• When n = 1, the join of X and $\{1\}$ is given by

$$CX = X * \{1\}$$

• When n = 2, the join of X and $\{0, 1\}$ is given by

$$\Sigma X = X * \{0, 1\}$$

Example 12.4.3

Let F be a homotopy functor. We consider the intermediate functors T_nF for a homotopy functor F.

• When n = 0, $T_0F : \mathbf{Top}_* \to \mathbf{Top}_*$ is a functor defined by

$$T_0F(X) = F(CX) \simeq F(*)$$

because F is a homotopy functor. If F is reduced then $T_0F(X) \simeq *$.

• When n = 1, $T_1F : \mathbf{Top}_* \to \mathbf{Top}_*$ is a functor defined by

$$T_1F(X) \simeq \Omega F(\Sigma X)$$

because F is a homotopy functor.

Example 12.4.4

Let F be a homotopy functor. We consider the intermediate functors P_nF for a homotopy functor F.

• When n = 0, $P_0F : \mathbf{Top}_* \to \mathbf{Top}_*$ is a functor defined by

$$P_0F(X) = (F(X) \to (T_0F)(X) \to (T_0(T_0F))(X) \to \dots) \simeq P_0F(*)$$

because F is a homotopy functor. If F is reduced then $P_0F(X) \simeq *$.

• When n = 1, $P_1F : \mathbf{Top}_* \to \mathbf{Top}_*$ is a functor defined by

$$P_1F(X) \simeq_{n\to\infty} \Omega^n F(\Sigma^n X)$$

because F is a homotopy functor.

12.5 Important Theorems

Denote Sp by the category of spectra. Define a map $\mathcal{L}(\mathbf{Top}_*, \mathrm{Sp}) \to \mathrm{Sp}$ that sends $F: \mathbf{Top}_* \to \mathrm{Sp}$ to the spectra $F(S^0)$. Conversely, define a map $\mathrm{Sp} \to \mathcal{L}(\mathbf{Top}_*, \mathrm{Sp})$ by sending each spectra X to the functor $X \land -$.

Now define a map $\mathcal{L}(\mathbf{Top}_*) \to \mathrm{Sp}$ as follows. For each $F: \mathbf{Top}_* \to \mathbf{Top}_*$, $F(S^n)$ is a collection of spaces indexed by \mathbb{N} . As for the bonding maps $F(S^n) \wedge S^1 \to F(S^{n+1})$, this is defined as follows:

- 1. Consider the identity map id : $X \land Y \rightarrow X \land Y$.
- 2. By the smash-hom adjunction, this corresponds to a map $Y \to \operatorname{Map}(X, X \wedge Y)$.
- 3. Now composing with F gives a map

$$Y \to \operatorname{Map}(X, X \wedge Y) \to \operatorname{Map}(F(X), F(X \wedge Y))$$

(Why is the latter map continuous?)

- 4. By the smash-hom adjunction, this corresponds to a map $F(X) \wedge Y \to F(X \wedge Y)$
- 5. Taking $X = S^n$ and $Y = S^1$ gives the desired results.

At the same time, we can do the following:

1. We begin by noticing that

$$\begin{array}{ccc} X & \longrightarrow & * \\ \downarrow & & \downarrow \\ * & \longrightarrow & \Sigma X \end{array}$$

is a homotopy pushout.

2. Applying *F* sends the homotopy pushout to a homotopy pullback:

$$F(X) \longrightarrow F(*)$$

$$\downarrow \qquad \qquad \downarrow$$

$$F(*) \longrightarrow F(\Sigma X)$$

3. Since F is reduced, the diagram can be simplified into

$$\begin{array}{ccc}
F(X) & \longrightarrow * \\
\downarrow & & \downarrow \\
* & \longrightarrow F(\Sigma X)
\end{array}$$

- 4. Now recall that $\Omega(F(\Sigma X))$ is the homotopy pullback of $* \to F(\Sigma X) \leftarrow *$.
- 5. We obtain maps $F(X) \to \text{holim}(* \to F(\Sigma X) \leftarrow *)$ and $\Omega F(\Sigma X) \to \text{holim}(* \to F(\Sigma X) \leftarrow *)$ which are both weak

Now take the first map constructed $f: F(X) \wedge Y \to F(X \wedge Y)$ and substitute X and Y with our wanted values to get a map $f: F(S^n) \wedge S^1 \to F(S^{n+1})$. Adjunct it to the map $f: F(S^n) \to \Omega(F(S^{n+1}))$. Using the weak equivalences we obtained, we conclude that there is a diagram

$$F(S^n) \xrightarrow{f} \Omega F(S^{n+1})$$

$$\cong \qquad \qquad \cong$$

$$\text{Holim}$$

which we can prove to be commutative. By the two out of three property we easily conclude that f is a weak equivalences. This is exactly where the bonding maps come from.

We now have maps $\mathcal{L}(\mathbf{Top}_*) \rightleftarrows \mathrm{Sp}$. This actually gives an equivalence of categories. In fact, one can find out that it is a two step process:

$$\mathcal{L}(\mathbf{Top}_*) \rightleftarrows \mathcal{L}(\mathbf{Top}_*, \mathsf{Sp}) \rightleftarrows \mathsf{Sp}$$

Theorem 12.5.1

There is an equivalence of categories

$$\mathcal{L}(\mathbf{Top}_*, \mathbf{Sp}) o \mathbf{Sp}$$

given by $F \mapsto F(S^0)$.

Proof. Firstly, note that the above assignment defines a functor. Let $\lambda: F \Rightarrow G$ be a morphism in $\mathcal{L}(\mathbf{Top}_*, \mathbf{Sp})$. This means that for any $X \in \mathbf{Top}_*$, we have a map of spectra $\lambda_X: F(X) \to G(X)$. Applying $X = S^0$ gives our map of spectra $F(S^0) \to G(S^0)$. Composition is preserved in this construction, and if F = G then the identity natural transformation $\lambda: F \Rightarrow F$ gives the identity map $F(S^0) \to F(S^0)$ of spectra.

Now define a functor $\mathbf{Sp} \to \mathcal{L}(\mathbf{Top}_*, \mathbf{Sp})$ by sending each spectra X to the functor $X \land -$. We want to show that $X \land -$ sends homotopy pushouts to homotopy pullbacks. Cubical 10.1.9. So let

$$\begin{array}{ccc}
X_0 & \longrightarrow & X_1 \\
\downarrow & & \downarrow \\
X_2 & \longrightarrow & X_{12}
\end{array}$$

be a homotopy pushout in \mathbf{Top}_* .

13 Algebras and Coalgebras

13.1 Coalgebras

There is a need to revisit the definition of an algebra (over a field)

Proposition 13.1.1

A vector space V over a field k is an algebra if and only if there is a following collection of data:

- A k-linear map $m: V \otimes V \to V$ called the multiplication map
- An k-linear map $u: k \to V$ called the unital map such that the following two diagrams are commutative:

where the unnamed maps is the canonical isomorphisms.

Evidently, the map μ gives a multiplicative structure for V and Δ gives the unitary structure of an algebra. The diagram on the left then represent associativity of multiplication. Notice that such additional structure on V formally lives in the category \mathbf{Vect}_k of vector spaces over a fixed field k.

Therefore we can formally dualize all arrows to obtain a new object.

Definition 13.1.2: Coalgebra

Let V be a vector space over a field k. We say that V is a coalgebra over k if there is a collection of data:

- A k-linear map $\Delta: V \to V \otimes V$ called the comultiplication map
- An k-linear map $\varepsilon: V \to k$ called the counital map such that the following diagrams are commutative:

where the unnamed maps is the canonical isomorphisms.

Lemma 13.1.3

Every vector space V over a field k can be given the structure of a coalgebra where

- $\Delta: V \to V \otimes V$ is defined by $\Delta(v) = v \otimes v$
- $\varepsilon: V \to k$ is defined by $\varepsilon(v) = 1_k$

We would like to formally invert the definitions of algebra homomorphisms in order to define coalgebra homomorphisms.

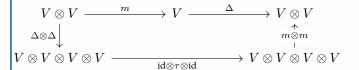

13.2 Bialgebras

Definition 13.2.1: Bialgebras

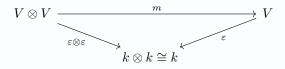

Let V be a vector space over a field k. We say that V is a bialgebra if there is a collection of data:

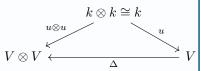

- A k-linear map $m: V \otimes V \to V$ called the multiplication map
- An k-linear map $u: k \to V$ called the unital map
- A k-linear map $\Delta: V \to V \otimes V$ called the comultiplication map
- An k-linear map $\varepsilon: V \to k$ called the counital map

such that (V, m, u) is an algebra over k and (V, Δ, ε) is a coalgebra over k and that the following diagrams are commutative:

where $\tau: V \otimes V \to V \otimes V$ is the commutativity map defined by $\tau(x \otimes y) = y \otimes x$.

Theorem 13.2.2

Let V be a vector space over k. Suppose that (V, m, u) is an algebra and (V, Δ, ε) is a coalgebra. Then the following conditions are equivalent.

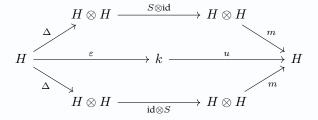

- $(V, m, u, \Delta, \varepsilon)$ is a bialgebra
- $m: V \otimes V \to V$ and $u: k \to V$ are coalgebra homomorphisms
- $\Delta: V \to V \otimes V$ and $\varepsilon: V \to k$ are algebra homomorphisms

14 Hopf Algebras

14.1 Hopf Algebras

Definition 14.1.1: Hopf Algebra

Let $(H, m, u, \Delta, \varepsilon)$ be a bialgebra. We say that H is a Hopf algebra if there is a k-linear map $S: H \to H$ called the antipode such that the following diagram commutes:

15 Differential Graded Algebra

15.1 Basic Definitions

Similar to how chain complexes and cochain complexes are two names of the same object, we can define differential graded algebra using either the chain complex notation or cochain complex notation. For our purposes, we will use the cochain version. This means that differentials will go up in index.

A differential graded algebra equips a graded algebra with a differential so that the algebra in the grading form a cochain complex.

Definition 15.1.1: Differential Graded Algebra

A differential graded algebra is a graded algebra A_{\bullet} together with a map $d:A\to A$ that has degree 1 such that the following are true.

- $\bullet \ d \circ d = 0$
- For $a \in A_n$ and $b \in A_m$, we have $d(ab) = (da)b + (-1)^n a(db)$

Lemma 15.1.2

Let (A,d) be a differential graded algebra. Then (A,d) is also a cochain complex.

Recall that a graded commutative algebra A is a collection of algebra over some ring A_0 , graded in \mathbb{N} together with a multiplication $A_n \times A_m \to A_{m+n}$ such that

$$a \cdot b = (-1)^{nm} b \cdot a$$

Such a multiplication rule is said to be graded commutative.

Definition 15.1.3: Commutative Differential Graded Algebra

A differential graded algebra A is said to be a commutative differential graded algebra (CDGA) if A is also graded commutative.

We will often be concerned of differential graded algebra over a field \mathbb{Q} , \mathbb{R} or \mathbb{C} . In particular this means that the algebra has the structure of a vector space.

16 Group Structures on Maps of Spaces

Req: AT3

H-spaces is a natural generalization of topological groups in the direction of homotopy theory.

Definition 16.0.1: *H***-Spaces**

Let (X,x_0) be a pointed space. Let $\mu:(X,x_0)\times(X,x_0)\to(X,x_0)$ be a map. Let $e:(X,x_0)\to(X,x_0)$ be the constant map $x\mapsto x_0$. We say that (X,x_0,μ) is an H-space if the following diagram:

$$X \xrightarrow{(e, \mathrm{id}_X)} X \times X$$

$$\downarrow^{(\mathrm{id}_X, e)} \downarrow^{\mu}$$

$$X \times X \xrightarrow{\mu} X$$

is commutative up to homotopy. The map μ is called H-multiplication.

Definition 16.0.2: *H***-Associative Spaces**

Let (X, x_0, μ) be an H-space. We say that (X, x_0, μ) is an H-associative space if the following diagram:

$$\begin{array}{ccc} X\times X\times X \xrightarrow{\mu\times\operatorname{id}_X} X\times X \\ \operatorname{id}_X\times\mu & & \downarrow \mu \\ X\times X \xrightarrow{\quad \mu \quad} X \end{array}$$

is commutative up to homotopy.

Definition 16.0.3: *H***-Group**

Let (X, x_0, μ) be an H-space. Let $j: (X, x_0) \to (X, x_0)$ be a map. We say that (X, x_0, μ, j) is an H-group if the following diagram:

$$X \xrightarrow{(j, \mathrm{id}_X)} X \times X$$

$$\downarrow \mu$$

$$X \times X \xrightarrow{\mu} X$$

is commutative up to homotopy. The map j is called H-inverse.

Example 16.0.4

Let X be a pointed space. Then the loopspace ΩX is an H-group.

Definition 16.0.5: *H*-Abelian

Let (X, x_0, μ, j) be an H-group. Let $T: (X, x_0) \times (X, x_0) \to (X, x_0)$ be the map T(x, y) = T(y, x). We say that (X, x_0, μ, j) is an H-abelian if the following diagram:

is commutative up to homotopy.

Definition 16.0.6: Natural Group Structure

Let (X, x_0) be pointed spaces. We say that $[Z, X]_*$ has a natural group structure for all spaces (Z, z_0) if the following are true.

- $[Z,X]_*$ has a group structure such that the constant map [e] is the identity of the group.
- For every map $f: A \rightarrow B$, the induced function

$$f^*: [B, X]_* \to [A, X]_*$$

is a group homomorphism.
